

■ Toy & Games Business Performance Dashboard

Microsoft Excel Dashboard Project Report

■ Project Description

The Toy & Games Business Performance Dashboard is an interactive Microsoft Excel Dashboard designed to analyze sales, profit, inventory, and product performance. It enables users to monitor key business metrics through KPI cards, Pivot Charts, slicers, and dynamic visualizations. The dashboard supports data-driven decision-making by providing insights into revenue trends, inventory status, top-selling products, and store performance.

■ Tools Used

- Microsoft Excel
- Pivot Tables
- Pivot Charts
- Slicers
- Excel Formulas
- Conditional Formatting
- Dashboard Design

■ Dashboard Overview

Main Dashboard – Full Overview

The main dashboard provides a comprehensive overview of the Toy & Games business by combining sales, profitability, inventory, and product performance into a single interactive interface. At the top, KPI cards display key business metrics such as Total Revenue, Total Profit, Profit Margin, Total Units Sold, and Total Stock, allowing users to quickly evaluate overall performance.

On the left side, interactive slicers for Store City, Month, Store Location, and Product Category enable users to filter the dashboard dynamically. Every chart and KPI updates instantly based on the selected filters, making the dashboard highly interactive.

The remaining visualizations include Low Stock Alerts for inventory monitoring, Top 5 Products for identifying best-selling items, a Monthly Revenue Trend chart for analyzing sales patterns, a Revenue by Product Category chart for category-wise comparison, and a Revenue by Store Location donut chart to evaluate the performance of different store locations. Together, these visualizations help users monitor business performance and make informed decisions.

City Filter Analysis

Store City Slicer Applied

This view demonstrates the Store City slicer, which allows users to analyze business performance for one or multiple cities. After selecting a city, all KPI cards, charts, and visualizations automatically update to display city-specific results.

Users can compare revenue, profit, units sold, inventory levels, and top-performing products across different cities. The monthly revenue trend and product category charts also adjust dynamically, making it easy to identify the best-performing cities and understand regional sales patterns.

Monthly Analysis

Month Slicer Applied

This screenshot highlights the Month slicer, which enables users to analyze sales performance for specific months or multiple months. The dashboard updates all KPIs and charts based on the selected time period, allowing users to identify seasonal trends and revenue fluctuations.

The monthly filter helps compare sales across different periods, evaluate product demand, monitor inventory requirements, and identify peak and low-performing months. This insight supports better sales forecasting and inventory planning.

Store Location Analysis

Store Location Slicer Applied

This view demonstrates the Store Location filter, allowing users to compare business performance across different store types such as Airport, Commercial, Downtown, and Residential. Selecting a location instantly updates every KPI and visualization.

The dashboard enables users to evaluate revenue, profit, inventory, and product performance for each location individually. It also helps identify which store locations contribute the highest revenue and where business improvements or inventory optimization may be required.

Product Category Analysis

Product Category Slicer Applied

This screenshot illustrates the Product Category filter, which allows users to focus on a specific category such as Art & Crafts, Electronics, Games, Sports & Outdoors, or Toys.

After applying the filter, the dashboard dynamically updates all KPIs and charts to display category-specific insights. Users can compare revenue, profit, top-selling products, inventory levels, and monthly trends for each category. This analysis helps identify the most profitable product categories, understand customer demand, and support strategic product planning.

■ Dashboard Features

The dashboard is equipped with multiple interactive components that make business analysis simple and efficient.

- **■ Interactive Slicers:** Filter data by Store City, Month, Store Location, and Product Category to perform customized analysis.
- **■ KPI Cards:** Display key business metrics including Total Revenue, Total Profit, Profit Margin, Total Units Sold, and Total Stock for a quick performance overview.
- **■ Monthly Revenue Trend:** Analyze monthly sales performance and identify seasonal trends.
- **■ Top 5 Products:** Highlights the highest revenue-generating products to identify best sellers.
- **■ Low Stock Products:** Displays products with low inventory levels, helping prevent stock shortages.
- **■ Inventory Restock Alert:** Provides actionable alerts for products that require immediate replenishment.
- **■ Revenue by Product Category:** Compares revenue generated by different product categories to identify the most profitable segments.
- **■ Revenue by Store Location:** Visualizes revenue distribution across Airport, Commercial, Downtown, and Residential stores for location-wise performance analysis.

■ Key Insights

- **Toys** contribute the highest share of total revenue, making them the best-performing product category.
- The **monthly revenue trend** helps identify seasonal demand patterns and peak sales periods.
- **Low-stock alerts** allow inventory managers to restock products before shortages affect sales.
- The **Top 5 Products** visualization helps identify high-demand products and supports inventory planning.
- **Store location analysis** reveals which locations generate the highest revenue and profitability.
- **Category-wise analysis** enables businesses to compare product performance and optimize marketing strategies.
- Interactive filters make it easy to analyze business performance from different perspectives without modifying the source data.

■ Conclusion

The Toy & Games Business Performance Dashboard demonstrates how Microsoft Excel can be used as a powerful business intelligence tool. By combining Pivot Tables, Pivot Charts, Slicers, KPI Cards, Excel Formulas, and Conditional Formatting, the dashboard transforms raw sales and inventory data into meaningful business insights.

Its interactive design enables users to monitor sales performance, profitability, inventory status, and product trends in real time. This project showcases practical Excel dashboard development skills, data visualization

techniques, and analytical thinking, making it an excellent addition to a data analytics portfolio and a valuable tool for business decision-making.
